

# Advanced Algorithm

## String Matching

### Horspool's Algorithm

Consider, as an example, searching for the pattern BARBER in some text:

$$s_0 \quad \dots \quad \quad \quad c \quad \dots \quad s_{n-1}$$

B A R B E R

Starting with the last R of the pattern and moving right to left, we compare the corresponding pairs of characters in the pattern and the text. If all the pattern's characters match successfully, a **matching** substring is found. (Then the search can be either stopped altogether or continued if another occurrence of the same pattern is desired.) If, however, we encounter a mismatch, we need to shift the pattern to the right. Clearly, we would like to make as large a shift as possible without risking the possibility of missing a **matching** substring in the text. Horspool's **algorithm** determines the size of such a shift by looking at the character  $c$  of the text that was aligned against the last character of the pattern.

## Try Yourself (Solution)

Text: JIM \_SAW \_ME \_IN \_A \_BARBER \_SHOP

Pattern: BARBER

Diagram illustrating the alignment of the pattern "BARBER" with the text "JIM \_SAW \_ME \_IN \_A \_BARBER \_SHOP". The pattern is shifted to the right in each step, with the last step showing a perfect match at the end of the text.

## Horspool's Algorithm

**Algorithm 2.11:** Horspool

Input: text  $T = T[0 \dots n]$ , pattern  $P = P[0 \dots m]$

Output: position of the first occurrence of  $P$  in  $T$

Preprocess:

- (1) for  $c \in \Sigma$  do  $shift[c] \leftarrow m$
- (2) for  $i \leftarrow 0$  to  $m - 2$  do  $shift[P[i]] \leftarrow m - 1 - i$

Search:

- (3)  $j \leftarrow 0$
- (4) while  $j + m \leq n$  do
- (5)   if  $P[m - 1] = T[j + m - 1]$  then
- (6)      $i \leftarrow m - 2$
- (7)     while  $i \geq 0$  and  $P[i] = T[j + i]$  do  $i \leftarrow i - 1$
- (8)     if  $i = -1$  then return  $j$
- (9)    $j \leftarrow j + shift[T[j + m - 1]]$
- (10) return  $n$

## String Matching Using Finite Automata

Example: String ending with '0'  
(One Accepting State)

• Accepted

0  
00  
10  
000  
010  
100  
110

• Rejected

$\Lambda$   
1  
01  
11  
001  
011  
101  
111

How many input symbols are required to change the state  
from "Accept" to "Reject" / "Reject" to "accept" ?

Example: String ending with '0'  
(One Accepting State)

Example: String ending with '11'  
(One Accepting State)

• Accepted

11  
011  
111

● Rejected
